

Electroencephalography in Disorders of Consciousness

Srivasa Chennu *PhD*

University of
Kent

**UNIVERSITY OF
CAMBRIDGE**

Consciousness as Information

Consciousness is simultaneously

- differentiated – each conscious state is one amongst a vast repertoire
- integrated – each conscious state is unitary and indivisible

Quantity of consciousness is a function of balanced integration and differentiation of information

Brain Networks in MEG

Source-reconstructed
MEG brain networks
from 10 minutes of
resting state data

Integration

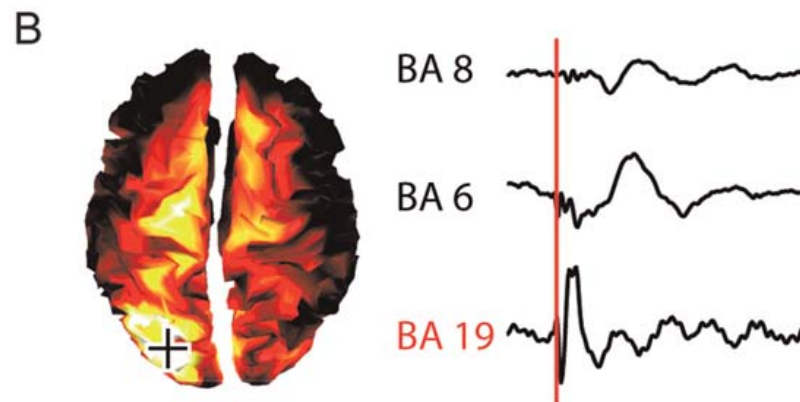

Cortical dynamics are complex and re-entrant during wakefulness

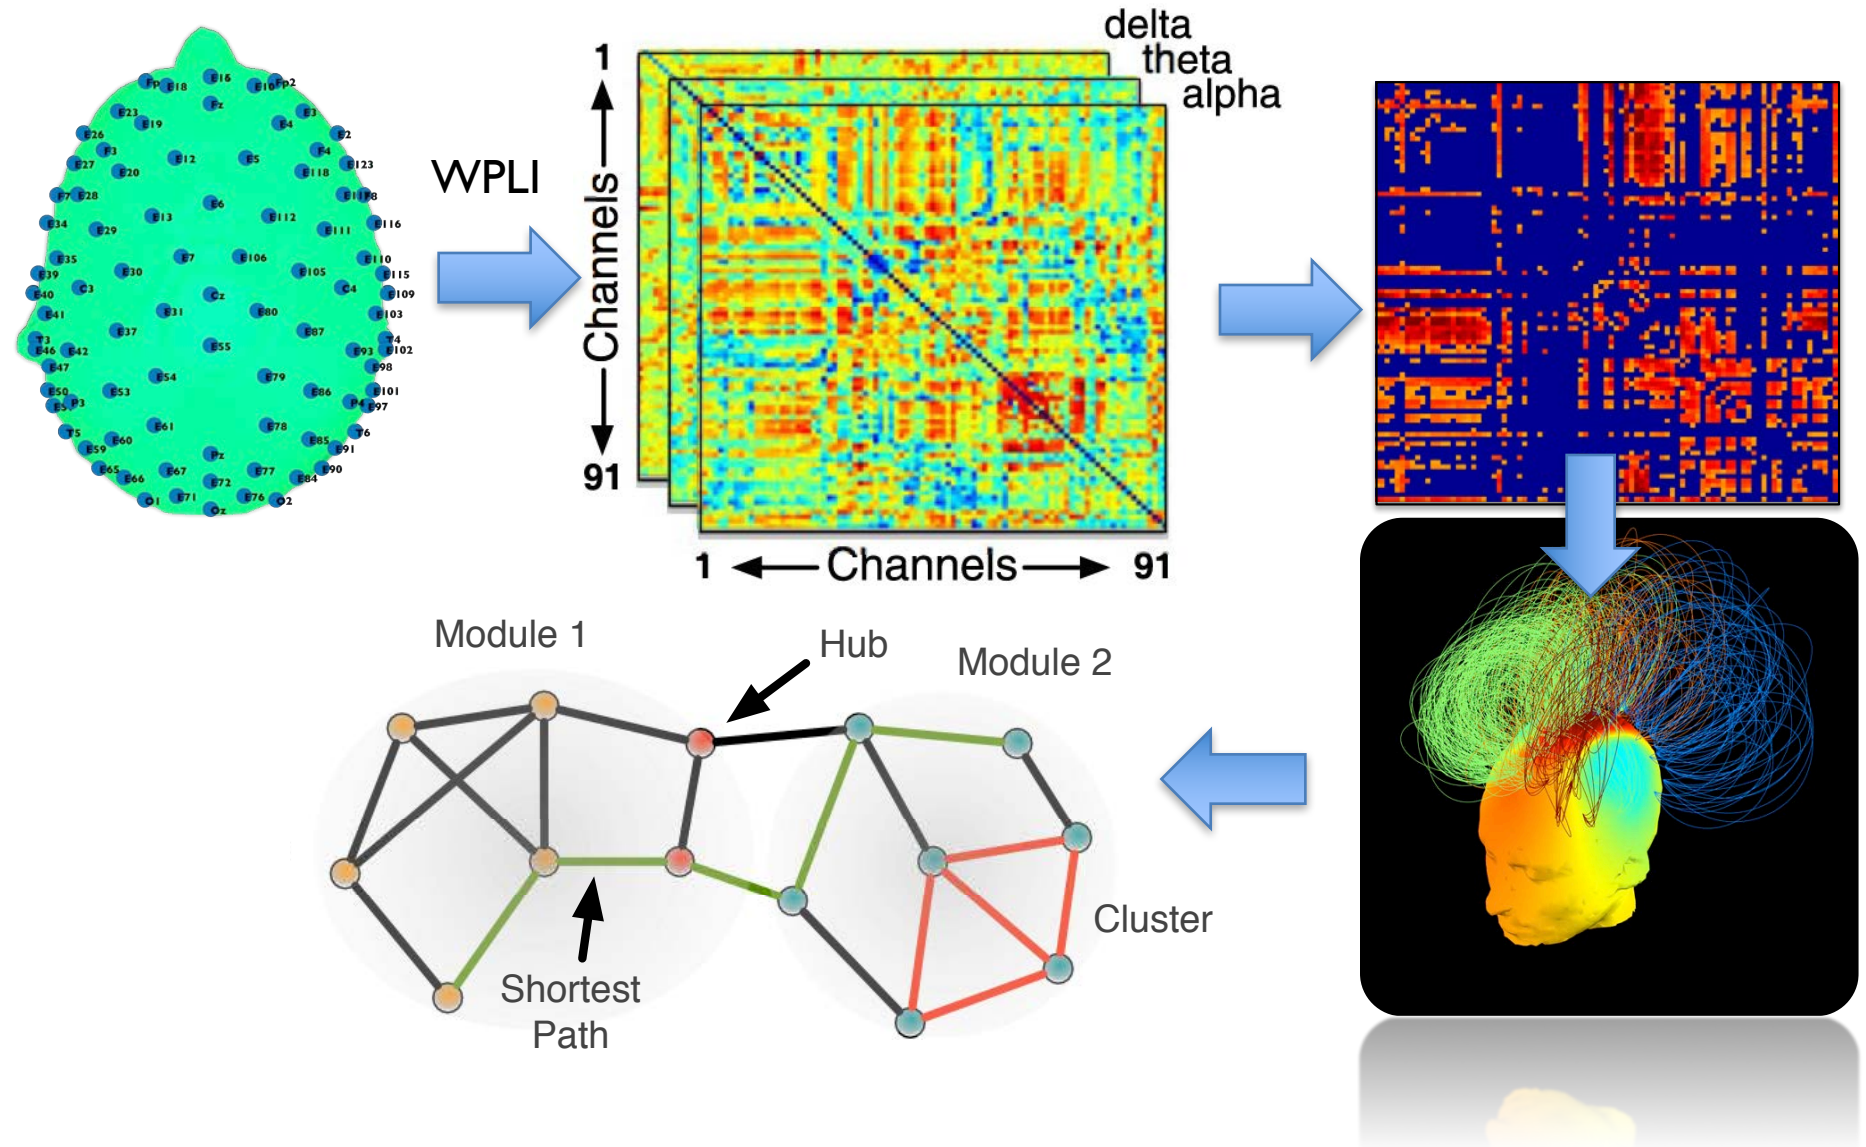

Differentiation

Cortical dynamics are spatially differentiated during wakefulness

Methodology

Quantifying Consciousness

Spectral Decomposition

Weighted Phase Lag Index
Chennu et al., 2014

Information Theory

Symbolic Mutual Information
King et al., 2016

Conscious Levels vs. Contents

Brain Networks in Sedation

Alpha Band

Baseline

Moderate Sedation

Recovery

Conscious Levels vs. Contents

After the ICU

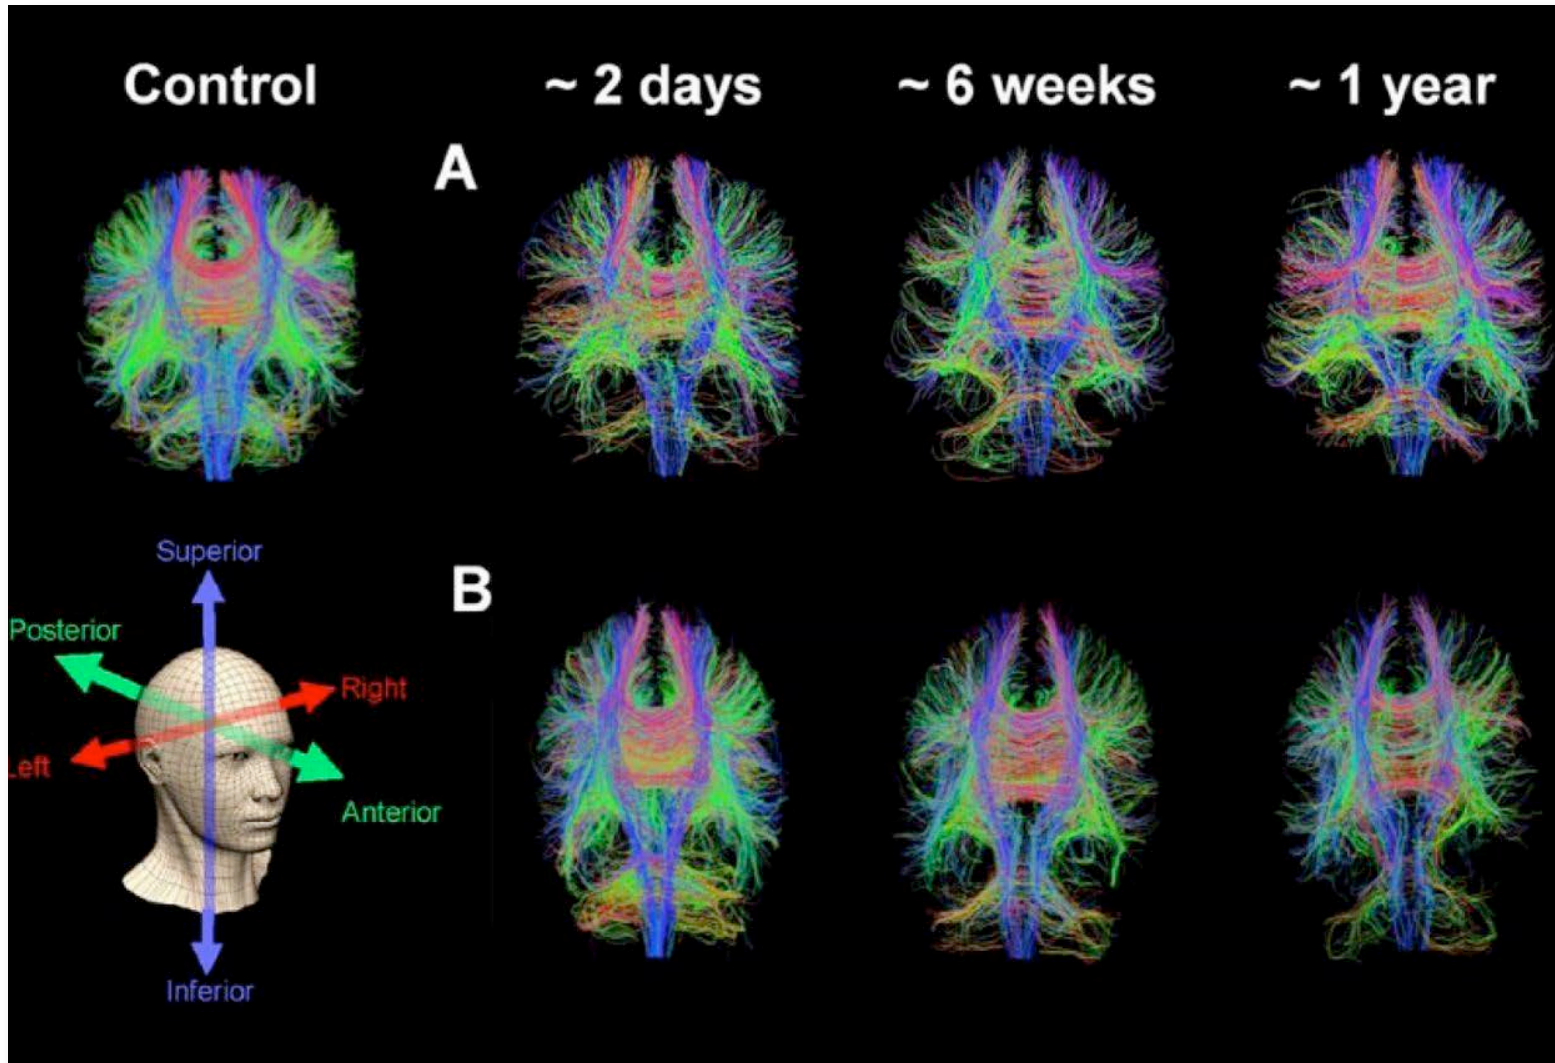

Addenbrooke's Hospital

Long-term Neurorehabilitation

Progressive Changes

Transcranial Magnetic Stimulation

Balance between integration and differentiation of brain networks improves with level of consciousness

Brain Networks in DoC

Alpha Band

Unresponsive
Wakefulness
(Vegetative)

Minimally
Conscious
(MCS)

Healthy adult

EEG predicts Outcomes

EEG characteristics predict GOS-E outcomes one year after assessment

EEG predicts Outcomes

Chi2 = 8.58, p = 0.003

EEG characteristics predict one-year outcomes

EEG and Admission Diagnosis

Admission diagnosis

Admission + EEG diagnosis

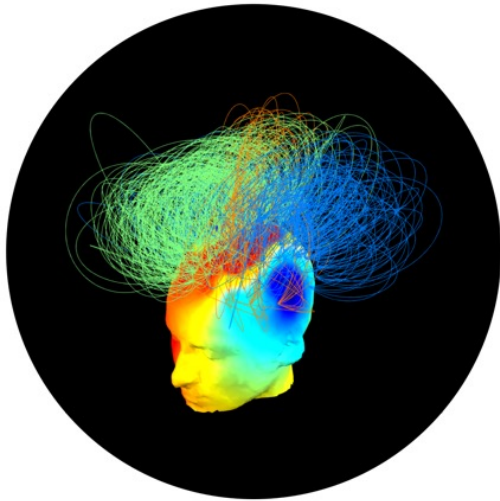

Fisher's exact test odds ratio = 0.34, p = 0.01

 Accurate clinical diagnosis
 Misdiagnosed

 Accurate clinical or EEG diagnosis
 Misdiagnosed

EEG significantly improves accuracy of admission diagnosis

Convergence in Individual Patients

Robust Small-world
networks

P300b

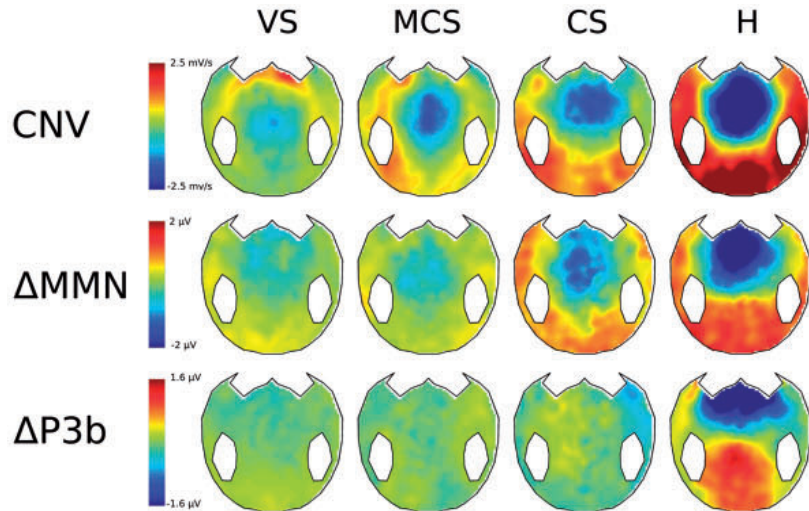

Tennis imagery

Promising convergent evidence in a vegetative patient who was

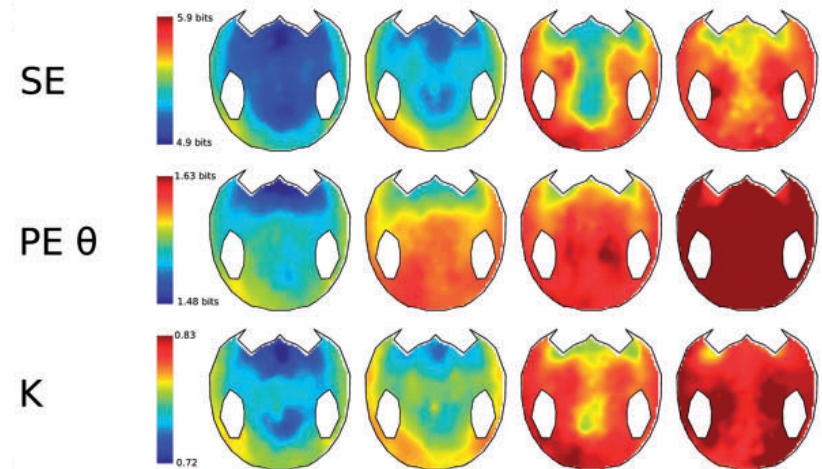

discharged on 23rd September 2011. He was in coma throughout his stay at Addenbrooke's and his neurological state on discharge was again coma with a Glasgow Coma Score of E1, VT, M3.

but made a behavioural recovery to full consciousness within a year.

Neural Signatures of Consciousness

Event-related Potentials

Signal complexity

Power

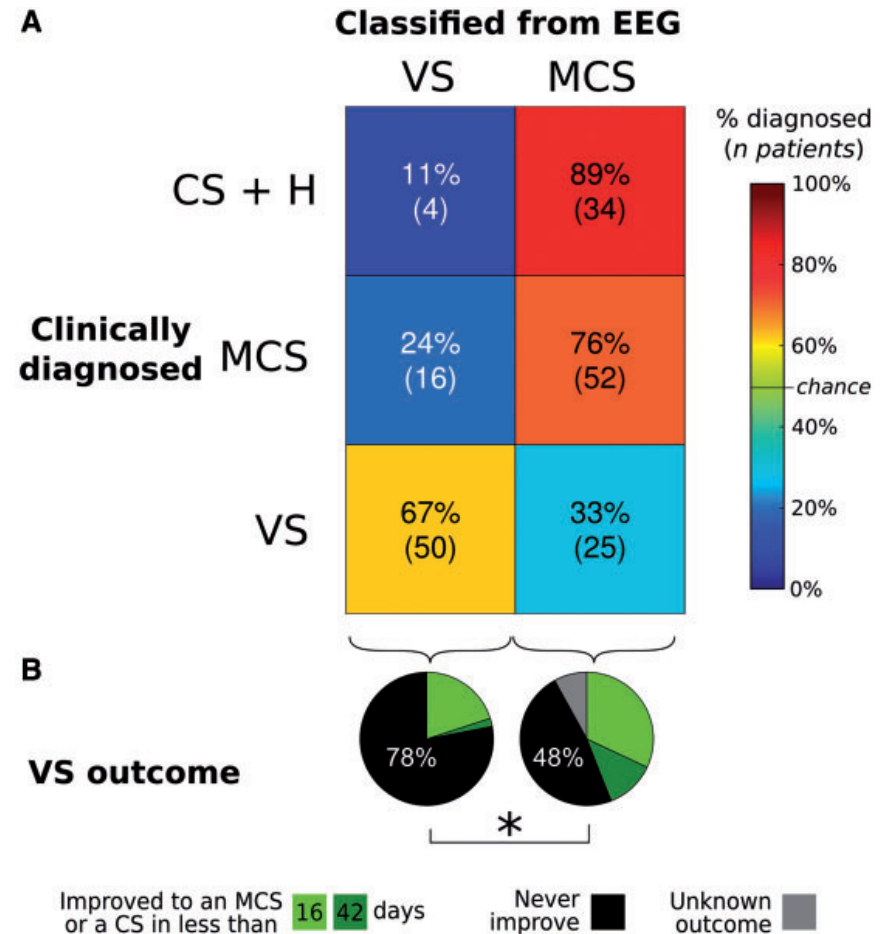

Brain Connectivity

A range of EEG-derived brain measures track the level of consciousness
Machine-learning to develop classification tools available at the bedside

Current Challenges

- Machine learning has been applied to detect consciousness using EEG
- Significant **divergence** due to
 - Arousal variation
 - Motivation and cognitive state
 - Signal quality and reliability
- A current research challenge
 - Fundamental requirement for clinical utility
 - And **bedside deployment** alongside clinical assessment

Summary

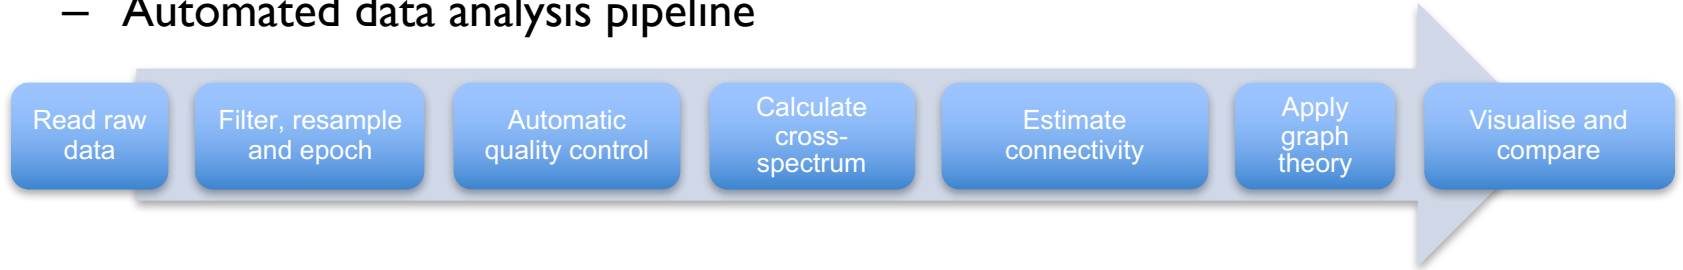

- **EEG Connectomics**
 - Applications in Disorders of Consciousness
- **Shadows of underlying cortical networks**
 - Correspondence with resting networks from fMRI
- **Applications**
 - Clinical diagnostics and prognostics
 - Bedside monitoring

Evelyn Trust Project

Recently funded Evelyn Trust funded project to develop

- Feasible frameworks to take EEG to the patient
- Aim to **longitudinally** acquire and analyse functional EEG
 - right at the patient's bedside, in rehabilitation centres in Cambridgeshire
 - Automated data analysis pipeline

- Develop clinically valuable EEG metrics and visualisations
 - Assess their diagnostic and prognostic utility
 - And relevance to individual patient trajectories
